SPRING-TINE HARROWS

The DIR EM is a spring-tine harrow designed to level and finish previously tilled soil. It is an essential tool for preparing a perfect seedbed, working precisely on the surface layers to remove clods and level the soil in preparation for sowing. Thanks to its lightweight, flexible structure, it can cover large areas, ensuring uniform conditions that promote even, vigorous germination.

Key Features

· Total Ground Contact: The flexible structure is designed to closely follow the ground profile, ensuring a perfect fit for micro-reliefs and uneven surfaces without any areas being left uncovered or skipped over.

· Precision Levelling: Thanks to the vibrating springs, the implement evens out the unevenness caused by primary tillage, ensuring a flat, uniform surface.

· Operational Versatility: It is available in a wide range of widths, from 200 to 550 cm, allowing it to adapt efficiently to both small plots and large farm areas.

· Customised Setup: The mechanical adjustment system enables you to set the ideal depth according to the consistency of the soil, thereby ensuring the best possible finish every time.

· Di Raimondo Reliability: The frame is constructed from high-strength materials to ensure structural stability and exceptional longevity, even after prolonged use over large areas.

Technical Data

Model	**Working width**	**Weight**
	CM	KG
EM-7	200	70
EM-9	250	85
EM-11	300	100
EM-13	350	120
EM-15	400	140
EM-17	450	160
EM-19	500	180
EM-21	550	200
